## Big Chem: Unit 17 Liquids

PRINT Name $\qquad$ Period $\qquad$

1. You have a sample of $\mathrm{H}_{2} \mathrm{O}$ with mass 23.0 g at a temperature of $-46.0^{\circ} \mathrm{C}$. How many joules of heat energy are necessary to:
a) heat the ice to $0^{\circ} \mathrm{C}$ ?, b) melt the ice?, c) heat the water from $0^{\circ} \mathrm{C}$ to $100^{\circ} \mathrm{C}$ ?, d) boil the water?, e) heat the steam from $100^{\circ} \mathrm{C}$ to $109^{\circ} \mathrm{C}$ ? The energies are as follows:
To warm ice (specific heat of ice) $=2.06 \mathrm{~J} / \mathrm{g}^{\bullet} \mathrm{C}^{\circ} \ldots .$.
To melt ice (the heat of fusion) $=334 \mathrm{~J} / \mathrm{g} . . .$.
To warm water (specific heat of water) $=4.18 \mathrm{~J} / \mathrm{g}^{\bullet} \mathrm{C}^{\circ} \ldots .$.
To evaporate water (heat of vaporization) $=2260 \mathrm{~J} / \mathrm{g} . . .$.
To warm water vapor (specific heat of steam) $=2.02 \mathrm{~J} / \mathrm{g} \bullet \mathrm{C}^{\circ}$
..Ans: $\mathrm{a}=2180 \mathrm{~J}, \mathrm{~b}=7680 \mathrm{~J}, \mathrm{c}=9610 \mathrm{~J}, \mathrm{~d}=52000 \mathrm{~J}, \mathrm{e}=418 \mathrm{~J}$.
2. Draw the Warming Curve for Water and label the FIVE parts.
3. Using the Warming Curve of Problem 2 and the Sample Problem found in your notes or at Sample Problem from the on-line notes, calculate the Total number of calories needed to change 20.0 grams of ice at $-15.0^{\circ} \mathrm{C}$ to water vapor at $+125.0^{\circ} \mathrm{C}$. See the Table of Heat Values for Water in your notes. Ans: 14,760 calories.

For Temperature Conversions:
Use the formula, $K=C+273$, so $C=K-273$.
4. Convert the following temperatures from Celsius to Kelvin:
a) $87^{\circ}$, b) $16^{\circ}$, c) $59^{\circ}$, d) $-68^{\circ}$, e) $73^{\circ}$. Hint: watch your signs!
5. Convert the following temperatures from Kelvin to Celsius:
a) $86^{\circ}$, b) $191^{\circ}$, c) $533^{\circ}$, d) $318^{\circ}$, e) $894^{\circ}$.
6. Discuss TEN of the "Shocks" of Boiling Point and Vaporization.
